UTAH COMMAND

Player guide & Apple submission handbook

Prepared for Larry Kuzniak • October 17, 2026

Command edition 0.19 • iPad project version 1.0, build 1

Developed and designed by **Larry Kuzniak**.
Development assistance: OpenAI ChatGPT/Codex.

A free, independent, single-player strategy game. Bug reports and suggestions: larrykuzniak@mac.com.

Package status: complete web game, bundled offline iPad source project, and documentation. The iPad project has not been compiled, signed, or tested on Apple hardware in this environment. This is not an App Store download or an approved release.

Your route without a Mac: retain your own Apple developer account, give the iPad source and this guide to a trusted Mac helper, test through TestFlight, then submit the validated build for Apple review.

Inside this handbook

1. Getting started, setup, and sharing

2. Field manual - current in-game rules

3. Apple submission and Mac-helper handoff

4. Listing and review notes draft

5. Device test checklist

6. Support, credits, privacy, and distribution notice

Apple requirements were checked against official Apple documentation on October 17, 2026. Recheck before submission. This guide is intended to be printed or kept with every copy.

1. Getting started

Utah Command - Command edition 0.19 / distribution package 1.0-preparation
Developed and designed by Larry Kuzniak. A free, single-player, turn-based strategy game.

Start on iPad

If installed from the App Store or TestFlight, tap Utah Command. The bundled iPad edition needs no account and plays offline. This package is preparation source, not an installable App Store download.

For the hosted web edition, open the address supplied by Larry in Safari. The current hosted copy is restricted; use an account authorized by its owner. Tap Share, then Add to Home Screen (under View More if shown), enable Open as Web App if offered, and tap Add. Launch online and wait for Offline play ready before disconnecting.

Your first battle

• Use Scenarios to choose Utah · Beach Exits. Read its briefing, objective flags, turn limit, available supply, and air missions.

• Leave Advanced Rules and Operational depth off for your first battle. Leave automatic supply priorities in use. Select First game for the guided tour.

• Tap a blue American formation or its name in the roster. A gold halo and SELECTED label identify it. Gray counters are German; red counters represent British or Canadian troops where present.

• Tap Move, then a legal highlighted destination. Or tap Attack and a spotted enemy. Infantry and tanks attack adjacent hexes; artillery has a four-hex range. Issue orders to other formations.

• Tap Resolve turn to execute orders and let the computer respond. Read the situation report. Repeat until the scenario ends.

Command by intent

Open Command missions and enable Command mode. Assign Seize, Defend, Support, or Reserve, then choose a risk policy. Missions persist across turns. A direct move or attack overrides the mission for one turn; Rest / cancel pauses it. Attached artillery and engineers work under the formation's existing authority, subject to resources and rules. Additional support may ask for approval. Air requires approval and a working Army link.

Map and supplies

Full-screen map makes more room; Menu returns to other controls. Terrain overlay shows exact hex terrain; painted background roads are illustrative. Fog of war hides unobserved forces. A question-mark contact is an old sighting. Supply Command shows delivery requests, priorities, routes, and forecasts. Priority cannot repair a blocked route.

Keep your progress

Orders and turns autosave locally. Export save makes a JSON backup; import restores a compatible backup after confirmation. Native iPad exports use the share sheet: choose Save to Files. Native imports use the Files picker. Use separate scenario export/import for custom designs. Export before deleting the app, clearing website data, changing devices or addresses, or restarting a battle. Saves do not automatically transfer between Safari, the Home Screen app, and the native app. Exit without saving rolls back this session's changes, including its autosaves.

Give someone a copy

After approval, share the App Store link. Before approval, invite testers through TestFlight after uploading a signed build. To share the web source now, give them this entire ZIP and these instructions. The web folder must be served over HTTPS for iPad installation. Tapping index.html in Files or opening a ZIP preview will not install the game. No paid services or API keys are required by the bundled gameplay.

Help and feedback

This game is offered free. Larry intends to keep it free and does not intend to sell it. Bug reports and suggestions help improve it. Email larrykuzniak@mac.com with the scenario, turn, rules settings, expected and actual result, steps to reproduce, iPad model and iPadOS version. A screenshot or exported save is helpful; remove personal material first. Support is provided as available.

2. Field manual

Your field manual

Scenarios: Use Scenarios to switch battles. Each has its own map, forces, supply allowance, air missions, and deadline. One battle per scenario saves on this device. Resume through Scenarios; New game restarts only the current scenario. Export for an independent backup. All maps and force mixes are illustrative.

Mission: Advance scenarios end immediately if you secure all three flags, or give a limited victory for holding two at the deadline. Hold the Beachhead requires at least two flags at the end of turn 10; holding all three does not end that defensive scenario early. Flags retain ownership until occupied by the other side.

Situation reports: Opening briefings and reports after every turn are available from Situation report. Choose an older report to review it. Automatic reports can be turned off in that window. Reports include friendly strength changes, supplies, air missions, reinforcements, objectives, and observed enemy activity. Enemy intelligence respects fog of war.

Illustrated map: The continuous Normandy illustration follows the first concept map. Switch on Terrain overlay to see the exact movement terrain of each game hex. Roads and buildings in the background artwork are illustrative; game terrain and movement costs are defined by the overlay. The same battles and saved positions are used.

Movement preview: Gold-bordered hexes show where the selected unit can move this turn after projected supply delivery. Hidden enemy units may still block an advance.

• Tap an American counter (or its name in the unit list).

• Choose **Move**, then tap a destination. The dashed line shows your planned route. Units advance as far as their movement allowance permits; issue another order next turn to continue.

• Or choose **Attack**, then tap an enemy. Infantry and tanks attack adjacent hexes; artillery reaches four hexes.

• Issue orders to your other units, then tap **Resolve turn**. The Germans respond automatically.

Fog of war & intelligence: Toggle fog above the map at any time. Infantry and tanks spot enemy units within 3 hexes; artillery spots within 2. Spotting is shared by each side. With Operational depth off, terrain does not block line of sight; turn it on through Operations for hedgerow and town obstruction. Dimmed terrain is outside current observation. A dashed question-mark counter is a last-known position, not a confirmed unit. It disappears when troops search that hex and find it empty. Intelligence lists current sightings and the turn and hex of older contacts. Air and ground attacks require a spotted target with fog on; lost air targets preserve the mission. Turning fog off reveals all current enemies, but intelligence records only actual troop observations. The German computer follows the same spotting ranges when fog is on. All remaining units are shown when the battle ends.

Counter colors: Americans are blue; Germans are gray. Red is reserved for British and Canadian forces. Canadian units are available in the Juno scenario. Counter symbols and INF / ARM / ART labels distinguish infantry, armor, and artillery. The selected unit is enlarged, marked by a bright gold halo and SELECTED nameplate, and drawn over a dimmed map. The unit list and supply list also highlight your selection. Select a unit by its name in either list; Clear selection above the map removes the highlight.

Movement: Infantry 3, tanks 4, artillery 2 points. Marsh and hedgerows cost 2; other land costs 1. Units cannot stack or pass through occupied hexes.

German opponent: The computer guards objectives, coordinates target selection to reduce wasted fire, moves reserves toward threatened flags, positions artillery for ranged fire, and withdraws damaged units when a safer hex is available. Safe units may rest to recover. With fog on, tactical decisions use current German sightings; the computer cannot read your queued orders.

Scenario builder: Open Scenario builder in the header. Copy the current battlefield or start with a blank field map. Set the name, turns, supplies, air support, allied faction, and victory condition. Select a tool to paint terrain, place or remove units, or move each of the three flags and set its initial owner. HQs are added automatically when playing. Save stores the design on this browser and adds it to Scenarios. Save & play starts a new battle and asks before replacing a saved battle for the same design. Export and Import transfer a scenario design independently of game saves. A design already used in a battle is saved under a new identifier when edited, preserving the old battle. The workshop keeps up to twelve saved designs.

Operational depth: Open Operations in the header and enable Operational depth. This also enables Advanced Rules. With it off, classic movement and observation remain available. Roads connecting road/town hexes cost half a movement point; marsh and hedgerows cost two. Crowded beaches (at least five formations on beach terrain) cost two to enter.

Line of sight: Intermediate hedgerow and town hexes block observation; adjacent hexes remain visible. Spotting is shared. Indirect artillery fire requires a friendly observer even with fog disabled. Smoke still reduces losses without blocking observation.

Rivers and bridges: The blue river boundary and labeled crossings are exact operational overlays. Infantry can ford for three movement points (two with engineers). Engineers also let tanks ford for two. Artillery, HQs, and supply transport require intact bridges. Damaged crossing edges are impassable; infantry may ford elsewhere. Adjacent engineer-capable troops can Repair or Demolish through Operations. Engineering resolves before movement and consumes two supply points.

Zones and reserves: Infantry and armor exert an adjacent zone of control unless pinned. Entering an enemy zone ends movement; movement directly between enemy-controlled hexes is prohibited. You may withdraw to a free hex. Reserve orders last one turn: choose Reinforce or Counterattack, tap Assign reserve, then a friendly formation within three hexes. A ready reserve in command reacts up to two movement points to observed adjacent threats after normal movement. Counterattack may then attack an adjacent enemy. Tanks held in reserve consume two supplies. Pinned units or units with cohesion below 40 cannot react.

Cohesion: Operational combat disruption reduces cohesion as well as suppression. Low cohesion reduces firepower; below 40 it also reduces movement, prevents preparation, and prevents reserve reaction. Unhit units recover five cohesion while acting or fifteen while resting.

Combat estimates: Select Attack to see estimated firepower ratios, losses, return fire, cover, readiness, preparation, and attachments for currently spotted targets. Forecasts use current positions and planned supply; movement, bombardment, smoke, reactions, and enemy actions may change the result. Ratios are comparative firepower, not probabilities of victory.

Utah operations: With Utah events enabled, two illustrative airborne detachments appear inland after the first resolution. Infantry and engineers are due after one further turn; tanks and a field battery after three. No more than one formation lands in each beach sector per turn, and a sector with two occupied

beach hexes delays landing. Clear beach sectors to admit follow-on waves. German infantry and armor arrive after an uncertain three-to-five-turn interval, subject to entry space. These replace the normal Utah follow-up infantry schedule; other scenarios retain their own reinforcement schedules.

Map size and holding box: Full-screen map fills the browser viewport, keeping Move, Attack, Rest, Resolve turn, air support, and Menu available. Tap Normal size to restore the dashboard; Escape also returns when no dialog is open. The compact action dock sits beside the map on a wide screen or underneath it in portrait. Unit details & advanced orders opens mission controls and the roster. The rear is a holding box below the map, not a second hex area. Open it to select a staged HQ. Choose Move, then a battlefield hex to advance it onto the map during resolution. Select a deployed HQ and Return HQ to holding box to withdraw it toward the rear using its normal movement allowance.

HQ deployment: HQs start east of the infantry/armor line: Regiment, then Division, Corps, and Army farther to the rear. The Rear holding box is abstract staging, separate from the 9 x 9 battlefield. Only HQs use it. HQs can move onto the battlefield through the eastern edge. Existing battles receive this setup correction once; subsequent HQ moves are retained.

Headquarters: Open Headquarters in the top header. The Regiment (III), Division (XX), Corps (XXX), and Army (XXXX) command posts are selectable counters; use Move to reposition them. The command desk shows ranges, headquarters condition, and each field formation’s reporting HQ. Select Show on map to inspect a command post and its range; Show command links displays the network. Assign formations directly to Regiment, Division, Corps, or Army from the desk. Command restrictions on reserve support apply with Advanced Rules. Headquarters cannot attack, return fire, capture flags, or prevent defeat after all field formations are eliminated.

Exit without saving: Use Exit game in the top header, then Exit without saving. This restores every scenario visited during this browser session to its starting save, including undoing this session’s autosaves, and displays an exit screen. Close the tab or choose Resume saved game. Safari may keep the tab open; the game does not force-close it.

Advanced Rules: Turn on the header toggle for suppression, preparation, and artillery missions. It is optional and saved separately in each scenario. Turning it off clears suppression, preparation, smoke, and advanced-only orders. Ammunition is retained.

Suppression: Levels 0-3 reduce firepower by 20% per level. Levels 2-3 also reduce movement by one. A formation hit this turn retains its suppression; otherwise it recovers one level while acting, or two while resting. Ground hits add one level. Suppression barrages add two even if they cause no strength losses. These rules apply to both sides.

Hasty or deliberate: Infantry and armor can attack immediately using Hasty, or choose Deliberate and target an adjacent enemy to spend a turn preparing. Next turn, keep Deliberate selected and target the same enemy again to attack with +2 losses. Moving, attacking, switching off Advanced Rules, or letting that next turn pass uses or cancels the preparation. A displaced, destroyed, or unspotted target may invalidate the attack.

Artillery missions: Batteries start with six ammunition points. Destructive fire uses two and adds one suppression. Suppression fire uses one, causes light losses, and adds two suppression. Both sides' barrages resolve together after movement and air strikes, before ground assaults. Destroyed ground units cannot attack. German batteries select destructive or suppression fire automatically. A resting battery with an open supply route and at least two supply reserves replenishes one ammunition point, up to six. Ammunition and supply reserves are separate; all firing batteries need at least one supply reserve.

Smoke and defensive fire: Select Smoke, tap Attack, then any land hex within four hexes. Smoke reduces incoming losses in that hex by two during this resolution, including your own fire against an enemy in smoke; it does not block spotting. Smoke clears at the next resolution. Select Defensive support, tap Attack, then a friendly counter within four hexes. The battery fires at one spotted enemy attacking that formation, provided the attacker is also within four hexes. If no eligible attacker appears, ammunition is retained. Mission readiness still consumes two supply points. Explicit artillery missions override inherited attachment orders.

Attachments: Open Attachments in the Orders panel. Assign on-map tanks or artillery to infantry; they retain their own counters, movement, supply, and range. If they have no order, they inherit their host's attack at resolution; explicit orders take precedence. Outside Command mode, movement is ordered separately. In Command mode an attached field battery follows its host's mission automatically; direct battery orders take precedence. Division, Corps, and Army each offer three finite off-map support units. Choose a receiving formation and use Attach, Reassign, or Release. Two field and two off-map attachments per host. Off-map bonuses, requirements, and current assignments appear in the support desk. Existing saves receive the new reserve pools automatically.

Combat: All movement occurs before fire. Bombardment resolves before ground assaults in both rulesets. Ground exchanges within their phase are simultaneous. Adjacent targets return fire against infantry or tanks. Cover and low strength reduce losses. Artillery causes no return fire. Use the Fog of war checkbox above the map to show or hide unspotted enemy units.

Supply Command: The header button opens a dedicated logistics desk. Choose My delivery requests to set 0-3 delivery points per unit. Requests repeat; High priority is served first, then Normal, then Low. Ties favor lower reserves then unit ID. Sustain this turn asks only for the points needed to pay current consumption; Rebuild reserves asks to fill each unit to 3. Both presets turn on manual requests. All entries share one scenario pool; unused points expire. Choose any, northern, central, or southern entry sector and shortest, road-favored, or cautious routing for each unit. Cautious routing avoids hexes next to observed enemies where practical; exposure is a warning, with no truck losses or road-capacity limits modeled. Forecasts assume current orders and positions. Fog may hide blockers that prevent an actual delivery.

Supply priorities: The Allied delivery allowance depends on the scenario; the supply panel shows the current limit. Each unit holds 0-3 reserve points, starting at 2. Supplies go to High, Normal, then Low priority, filling each unit to 3 before moving to the next. Ties favor lower reserves, then unit ID. A unit needs an unblocked land route to the eastern supply edge to receive supplies; enemy-occupied hexes block the route. The selected unit's route is shown in blue dots. Your supply panel previews deliveries before you resolve. German supplies are managed automatically from their west edge.

Consumption: Every unit uses 1 point each turn, including resting units. Moving tanks and attacking artillery use 2. Deliveries arrive before movement and combat; consumption happens afterward. A connected unit may still be short of supplies if other units have higher priority. Unused deliveries expire each turn.

Readiness: With 2-3 reserve points after delivery, units have full firepower and movement. At 1, firepower falls to 80% and movement loses 1 point. At 0, firepower is 55% and movement loses 1 point. Movement always allows at least 1 point. Isolated units can use reserves until they run out; priority cannot restore a blocked route.

Fatigue & rest: Three fatigue points reduce movement by 1. Rest removes two fatigue and restores one strength only with an open route and at least 2 reserves after delivery. Rest still consumes supply.

Air support: Your scenario briefing sets the fighter-bomber mission allowance, with one strike per turn. Tap Assign air strike, then a German counter. You may change or cancel the target before resolving. Aircraft follow the targeted formation after movement and inflict 2-4 strength losses plus one fatigue before ground fire. A formation destroyed by air attack cannot fire. This first version has guaranteed air availability, with no weather or anti-aircraft simulation.

Reinforcements: Two Allied infantry detachments arrive at the turn specified by the scenario if the entry hexes are free. The situation report lists their expected arrival.

Mission command: Open Command missions from the header or full-screen Menu. Assign Seize or Defend an objective, Support a formation, or Reserve for a formation. Choose cautious, balanced, or aggressive risk. Orders persist across turns and reinforcements inherit nearby standing intent. Cyan dashed lines show intended movement; gold hexes remain the direct-control movement range. Issue a mission to one battalion or all maneuver formations. Direct moves and attacks override a mission for one turn; Rest / cancel pauses it. Cancel mission returns the formation to direct control. Turning Command mode off suspends all autonomous execution.

Authority: Attached reserve artillery and engineers provide their normal benefits automatically. Attached field batteries follow the host and fire without asking again. With Operational depth, mission engineers can repair an adjacent damaged crossing on the route. Range, supply, readiness, and applicable command links still matter. Default local delegation also authorizes free batteries sharing the requester’s HQ. Change to Ask about all additional support to approve those individually. Air strikes always require approval and an Army link. Only one air strike and one task per battery may be committed in a turn. Direct orders on a battery reserve it for your task.

Command review: Resolve interrupts only for support needing your approval. Approve the request, continue without it under the unit’s risk policy, or hold the formation. Continue commits the turn; Cancel leaves saves, positions, and resources untouched. You can always open a full next-turn review from the mission desk. Disconnected formations continue standing intent locally; they report why coordinated support is unavailable. New threats, hidden blockers, or enemy movement can invalidate a forecast.

Learning and reports: First game opens a six-step guide. Subordinate reports explain progress, blocked routes, recovery, and lost support targets. Combat dispatches show strength, readiness, cover, attachments, and (with Advanced Rules) preparation, suppression, and smoke. The scenario terrain and force mixes are schematic, illustrative designs.

Saving: Every order and turn saves in this browser when storage is available. Export a save for a backup or to transfer between devices. Safari’s Share > Add to Home Screen gives you an app-style shortcut. Sign in to ChatGPT if the private link asks.

3. Apple submission

Prepared October 17, 2026. Recheck Apple's linked requirements before upload.

What is ready, and what remains

The ZIP contains the current web game and an iPad-only Xcode project. It bundles all gameplay files locally and adds native Files import, share-sheet JSON export, local-save backup, JavaScript confirmation dialogs, and a native help toolbar. This is a source preparation, not a compiled or signed release. Linux has no Xcode or iPad simulator here. Native source has not been compiled or device-tested. Do not describe this package as App Store ready until the checks below pass.

Larry has no Mac. Arrange a trusted Mac helper with a Mac that supports the current Xcode release, or a suitable hosted Mac development environment. The source package can be handed to that helper without granting the private Site. A free Safari/Home Screen edition can be used while App Store work proceeds.

1. Larry: establish ownership

Enroll as an individual in the Apple Developer Program using your own Apple Account with two-factor authentication. US membership is currently $99/year, even when the customer pays nothing. Individual enrollment displays your legal name as seller. A credit to ChatGPT/Codex does not make OpenAI the publisher. Keep your account, agreements, and releases under your control. Review any region or trader-status questions Apple presents. Confirm app-name availability.

2. Mac helper: open and configure the project

Unzip the complete package. Open ios/UtahCommand.xcodeproj, select the UtahCommand target, and choose Signing & Capabilities. Select Larry's team and automatic signing. The default bundle ID is com.larrykuzniak.utahcommand; register it only if available to Larry's team, or change it to a unique identifier and use that same identifier in App Store Connect. Keep the final ID stable. Set the legal copyright and selected development team. App version starts at 1.0, build 1; increase the build number for every uploaded replacement.

Use current Xcode. Apple's current minimum upload requirement, effective April 28, 2026, is Xcode 26 or later with the iOS/iPadOS 26 SDK or later. The project's iPadOS 16 deployment target controls compatible devices, not the SDK used to build; verify the chosen Xcode still supports the deployment target. The target is iPad-only, with portrait and landscape orientations. Native app icon, Info.plist, privacy manifest, shared scheme, and Web folder are included. No third-party package manager, backend, API key, account, or remote gameplay server is needed. Confirm Web appears as a folder resource in Copy Bundle Resources; individual flattened HTML/JS copies would break relative paths.

If the helper cannot access Larry's signing team, build in the simulator first. Larry must then arrange signing/upload with an authorized team workflow or an owner-controlled Mac session. Individual memberships may limit delegation of Certificates, Identifiers & Profiles access. Do not solve this by publishing under the helper's own seller account. Do not share passwords or 2FA codes.

3. Build and test before uploading

Build with Product > Build, then run in an iPad simulator. Run the attached DEVICE-TEST-CHECKLIST.md on a physical iPad, including airplane mode, both orientations, export/import, scenario builder, command approvals, exit rollback, and persistence after force-quit. Test saves across an app update using the same bundle ID. Fix compilation or runtime failures before proceeding. Capture genuine screenshots of the signed app on Apple's currently required iPad display sizes. Do not use the concept map or promise features absent from the tested build.

Apple evaluates minimum functionality under guideline 4.2. A website shortcut is insufficient. This project runs a full offline game, with local scenarios, AI turns, mission command, native file workflows, and bundled help. Those features support a submission; Apple alone decides acceptance. If review asks for stronger iPad integration or UI improvements, address that feedback.

4. Public support and privacy pages

web/support.html and web/privacy.html are ready to host as static pages and name larrykuzniak@mac.com as the support contact authorized by Larry. Publish both on an HTTPS site accessible without signing in. Record the real URLs in the listing. The existing Utah Command Site is restricted to its owner; its support/privacy addresses are NOT valid public submission URLs yet. The bundled iPad game does not inherit that hosting login requirement. Do not submit placeholder URLs or a mailto address in a website URL field. Review the final privacy statement against the actual built app and any added SDKs. Draft app privacy answer is no developer/third-party data collection for this offline build; verify Apple's definitions, including support correspondence, and disclose accurately. The manifest declares app-only UserDefaults CA92.1 for local-save backup, no tracking, and no collected data. Re-audit if changed.

5. Create the App Store record and upload

In App Store Connect choose Apps > + > New App, iOS platform, Utah Command (or an available final name), English primary language, final registered bundle ID, and a stable SKU such as UTAHCOMMAND-IPAD-001. Use the listing draft in APP-STORE-LISTING.md, final support/privacy HTTPS URLs, copyright, actual screenshots, categories, and review contact details. Review contact phone number is still to be supplied by Larry privately to Apple. Set Pricing and Availability to Free and choose the countries/regions you intend to serve. No in-app purchases or subscriptions are included. The Paid Apps Agreement is needed for paid content; do not introduce it merely to make this app free.

Select a generic iOS device/archive destination in Xcode, then Product > Archive. In Organizer validate the archive, inspect the generated privacy report, and Distribute App > App Store Connect > Upload, using the options offered by the current Xcode release. Let the build finish processing in App Store Connect. Resolve validation errors and export compliance prompts for the actual binary. The provided Info.plist deliberately does not make an unverified encryption attestation. Complete Apple's questionnaire; standard Apple OS encryption and any changes must be considered rather than guessing an answer.

6. TestFlight first

Provide beta test information, feedback email, and contact details. Create an internal test group, then an external group if using outside testers. External beta builds can require Beta App Review. After approval share a TestFlight invitation; testers install Apple's free TestFlight app and accept it. Each beta build is usable for up to 90 days; this is not permanent App Store distribution. Use beta reports to fix bugs and repeat testing before public release.

7. Complete review and release

Complete the age-rating questionnaire based on the game's abstract wartime combat; let Apple calculate the rating. Do not assume a particular rating. Complete content-rights, privacy, encryption/export, availability, and required regional declarations. Verify the rights to every shipped asset, including the AI-assisted map artwork. Do not include original V for Victory code, graphics, manuals, or publisher branding without permission. The credits identify this as an independent game and do not claim an official remake or endorsement.

Select the processed build on version 1.0. Paste reviewed App Review notes, including that no login is needed and all gameplay is bundled. Supply Larry's review contact email and phone number. Choose manual release initially so Larry controls the launch. Add for Review, then Submit for Review. Approval is not guaranteed. Answer any review questions, make changes, and upload a higher build number if needed. After approval, release and share the real App Store URL.

8. Maintenance

Keep membership current and retain signing/account access, source package, backups, and the final accepted build's records. Investigate player reports via larrykuzniak@mac.com; record scenario, turn, rules, device/OS, and reproduction steps. For each release update version/build, release notes, offline cache version if web files change, documentation, privacy disclosures if needed, and test save migration before upload. Intended customer price remains Free.

4. Listing draft

Name: Utah Command (subject to availability) Subtitle: Normandy strategy by intent Primary language: English (U.S.) Developer/seller: Larry Kuzniak (Apple uses the verified individual legal name) Copyright: 2026 Larry Kuzniak Price: Free Suggested categories: Games / Strategy and Simulation, as available in Connect Keywords: Normandy,WWII,strategy,hex,turn-based,command,offline,wargame Support email: larrykuzniak@mac.com Support URL: REQUIRED - host web/support.html publicly over HTTPS first Privacy policy URL: REQUIRED - host web/privacy.html publicly over HTTPS first App Review contact phone: REQUIRED - Larry supplies privately to Apple Age rating: Complete Apple's questionnaire; no rating claimed in this draft

Description

Command the advance from the Normandy beaches in a turn-based strategy game built around clear orders, supply, and a thinking opponent.

Choose one of eight illustrative scenarios or create your own battlefield. Move formations directly, or assign persistent Seize, Defend, Support, and Reserve missions and let subordinate commanders execute your intent.

Manage artillery, engineers, air support, headquarters links, and supply priorities. Read situation reports, follow supply routes, and decide when to commit additional support. Optional Advanced Rules and Operational depth add preparation, suppression, smoke, cohesion, rivers, and reserve reactions.

The iPad edition bundles the game for offline play, keeps progress locally, and lets you export and import save files. A first-game walkthrough and field manual are included.

Utah Command is free, with no ads, subscriptions, or in-app purchases. Developer Larry Kuzniak welcomes bug reports and suggestions at larrykuzniak@mac.com.

This is an independent game with schematic maps and illustrative forces, not an exact historical simulation. Development assistance: OpenAI ChatGPT/Codex.

Review notes draft - update after device tests pass

Utah Command is a single-player iPad strategy game. No sign-in, purchase, or remote gameplay server is required. All gameplay assets are bundled locally. Tap First game for the walkthrough. Scenarios selects a battle. Select a friendly formation, tap Move and a destination or Attack and a visible enemy, then Resolve turn. Command missions enables persistent subordinate orders. The native toolbar provides Start here, Manual, and Support & credits. Save/scenario export opens the native share sheet; import opens Files. Please test offline. Public support and privacy URLs are listed in metadata.

Do not submit these notes until native features have been verified on a real iPad. No Apple testing or review approval is claimed by this package.

5. Device test checklist

Status: NOT RUN on Xcode, iPad simulator, or physical iPad in this preparation. Record device, OS, Xcode version, app version/build, date, tester, and results.

☐ Xcode project opens; resolves bundled resources and app icon; clean build.

☐ Simulator and physical iPad launch without crash or missing map/scripts.

☐ No ChatGPT login or network connection needed, including first launch.

☐ Airplane-mode full battle; all guides and support/privacy text accessible.

☐ Portrait, landscape, split view/resize, zoom, full-screen map and Menu.

☐ Move/Attack/Rest stay usable; touch targets, dialogs, text remain readable.

☐ First game walkthrough and eight scenario briefings function.

☐ Infantry/tank movement, artillery ranged fire, air strike, victory/defeat.

☐ Mission command persists; direct override and Rest pause behave as described.

☐ Organic attachments act without new approval; additional support review.

☐ Approval cancel leaves state/resources unchanged; approve resolves once.

☐ Supply forecast, route tracing, priorities, and turn situation reports.

☐ Advanced/Operational toggles, HQ links, engineers, reserves, bridge actions.

☐ Scenario builder saves/plays a custom design without corrupting a battle.

☐ Save export: native share sheet, Save to Files, file opens as valid JSON.

☐ Save import: Files picker, cancel, valid restore, bad/oversized rejection.

☐ Scenario export/import: same native file workflows; draft validates.

☐ Force-quit/relaunch preserves orders, missions, settings, and saved designs.

☐ Same-bundle-ID app upgrade preserves progress; verify exported recovery too.

☐ Native toolbar guide/game switching does not overwrite latest saves.

☐ Exit without saving restores every visited scenario to session start.

☐ Delete/reinstall behavior documented; exported save restores after reinstall.

☐ Email link opens configured mail app; contact text readable without Mail.

☐ VoiceOver labels/focus and contrast checked on actual game screens.

☐ Genuine final-build iPad screenshots captured at current required sizes.

☐ Public HTTPS support/privacy pages accessible in signed-out browser.

☐ Archive validation/privacy report/export compliance resolved.

☐ Rights review completed for artwork/code; no proprietary original assets.

☐ App Store price Free; no ads, subscriptions, or purchases configured.

☐ Accurate age rating, privacy answers, review phone and email, availability.

☐ TestFlight feedback reviewed; critical bugs fixed and rechecked.

☐ Larry approves final metadata and manual-release submission in his account.

6. Support & credits

Utah Command is offered free. There are no advertisements, subscriptions, or in-app purchases in this edition. Larry intends to keep it free and does not intend to sell it.

Bug reports and suggestions

Email larrykuzniak@mac.com. Include game edition, scenario, turn, rules enabled, device and iPadOS version, reproduction steps, expected result, and actual result. Attach a screenshot or exported save if useful. Please omit private information. Feedback is welcome; response times and fixes are not guaranteed.

Privacy information

Privacy information

Effective October 17, 2026. Developer: Larry Kuzniak. Contact: larrykuzniak@mac.com.

Bundled iPad edition

The included iPad source is designed to run its game files on your device. It includes no advertising, tracking, analytics, remote gameplay server, or account requirement. Game progress and custom scenarios are saved in app-local storage, with a local settings backup for continuity. The developer does not receive your progress automatically.

Files you choose

You may export saves or scenarios to a destination you select, or import files you select in Files. Exported files contain game state and scenario data. Their storage and sharing depend on your chosen destination. Deleting the app removes its local data, subject to device backup behavior. Keep exported backups for anything you wish to retain.

Voluntary support

If you email the developer, your email address, message, and attachments are received for answering the request and investigating feedback. Do not send sensitive personal information. Contact the developer to request deletion of support correspondence, subject to applicable retention obligations. Email delivery uses your email provider and the developer's provider.

Hosted web edition

The web game saves progress in browser-local storage and caches game files for offline play. Its current host may require ChatGPT sign-in and process account information and operational request logs under that host's policies. Those hosting practices are separate from the bundled offline app. Clearing website data removes local web progress and caches.

Changes

If data practices change, this page and the App Store privacy answers must be updated. The final signed app's privacy disclosures must be verified before release.

Distribution notice

UTAH COMMAND Developer, game designer, and project lead: Larry Kuzniak Development assistance: OpenAI ChatGPT/Codex AI-assisted map illustration. No Apple or OpenAI endorsement is implied. Copyright 2026 Larry Kuzniak, to the extent rights apply.

The game is offered free. Larry intends to keep it free and does not intend to sell it. You may share the complete unmodified package at no charge with these credits, documentation, and notices intact. Do not represent it as your own creation or sell copies under this permission. Source is supplied for building and maintaining this app; this notice is not an open-source license. Any third-party rights remain with their respective owners.

This is an independent game inspired by classic operational wargames. It is not affiliated with the owners of V for Victory and is not an official port. Maps, forces, and mechanics are illustrative. No original proprietary game code, manuals, or assets are intended to be included. Verify final asset rights before public distribution; free availability does not remove that obligation.

Bug reports and suggestions: larrykuzniak@mac.com Include scenario, turn, rules settings, expected and actual behavior, device and OS, and reproduction steps. Save files and screenshots can help. Support is offered as available; no warranty or promise of updates is made.
